Now in Black!

**Cheap wood sleepers can damage your
 work and reputation!**

KnuckleHeads

Loose-laid wood block sleepers deteriorate as a result of freezing, thawing, UV exposures and biological attack. Metal brackets corrode and screws back out. Movement, dirt and disintegrating wood create “rot spots” and often lead to premature death for properly installed roof membranes.

KnuckleHeads install quickly with tough **M-1**[®] structural adhesive / sealant.

Solid: **KnuckleHeads** adhered with **M-1** prevent water, ice and dirt from underriding support and attacking roofing membranes. Bonded **KnuckleHead** support systems minimize damage by wind, ice, flying debris, vandalism and seismic events. **KnuckleHeads** help disperse weight to the desired points along the bonded structure. Small membrane pads may be used to further disperse the weight.

Durable: **KnuckleHeads** are impervious to water, biological attack and freeze-thaw conditions.

Versatile: The adjustable **KnuckleHead** easily raises and lowers from a height of 3 1/8” to 4 1/8”, usually eliminating the need for a riser. It accommodates two 1/2” diameter pipes in small channels, or a single 1” pipe in a large channel.

Also available is the large 4” **KnuckleHead** via special order. The Large **KnuckleHead** accommodates two 1 1/2” pipes in small channels, or a 3” pipe in the large channel. For added height flexibility 2” **Risers** are available via special order. Contact CHEM LINK for projects involving larger pipes.

Adjustable: 4” diameter x 3 1/8” - 4 1/8” high
